The intelligent hybrid security based DDoS (distributed denial of service) consists of three components. Global threat intelligence, on premises security and network based security. The solution identifies DDoS attacks, web attacks, know and unknown malware based threats. The MetTel Anti DDoS System (ADS), which is a DDOS mitigation tool, is deployed in MetTel Core network that can scale to support hundreds of Gbps of inspected traffic. It is deployed in-line and it monitors the incoming traffic for signs of DDoS attack. It is also deployed out-of-path, which uses a Network Traffic Analyzer (NTA) that monitors traffic flow. At the core of the ADS are innovative, multi-stage detection engines. All packets are subjected to a series of analyses, checks, and validations to accurately identify both legitimate and attack traffic.	$1,000.00	Per GB	MRC
